

Sample Website Health Check

Example Business Ltd | example.com | Illustrative assessment

PUBLIC DEMONSTRATION

All website details, findings, measurements, scores and recommendations in this document are fictional. This is a representative sample of the report format, not a real scan or a security assessment of example.com.

Overall health status

NEEDS ATTENTION

78/100

Illustrative health score

Key findings

- 1. An example software update requires review
- 2. Two illustrative hardening items need checking
- 3. A selected page may benefit from optimisation

What's working well

- Example SSL certificate is valid
- Example WordPress installation is current
- A recent example backup is recorded
- Sample email authentication is configured

What needs attention

- HIGH Review one illustrative software security finding
- MEDIUM Review two example hardening controls
- LOW Investigate performance on a selected example URL

This report demonstrates how DevEdge presents findings, risk levels and prioritised recommendations. The example findings are not drawn from any customer website.

WHAT WE CHECKED

WordPress, PHP & server ALL CURRENT - Core software shown as current. - Runtime reported as supported.	Plugins & themes REVIEW - One example plugin update is pending. - One synthetic vulnerability finding needs assessment.
Security REVIEW - Two illustrative configuration checks need review. - Two administrator accounts detected (informational only).	Backups RECENT - A recent sample backup timestamp is recorded. - Restore capability has not been verified.
Homepage speed INVESTIGATE - Tested URL: https://example.com/. - Example mobile performance warrants investigation. - Only the selected URL was tested.	Uptime & errors NOT VERIFIED - The example site was accessible at assessment time. - Continuous uptime monitoring not verified.
Domain, email & links REVIEW - Example email authentication is configured. - One illustrative broken link requires follow-up.	Database HEALTHY Example database checks showed no issue.

YOUR ACTION PLAN

Technical issues

FINDING / PRIORITY	WHY IT MATTERS	RECOMMENDED ACTION
Example software finding HIGH	A fictional component has an illustrative security advisory; actual exploitability has not been assessed.	Check the affected version and apply an appropriate patch.
Two example hardening checks MEDIUM	Selected controls could improve resistance to common configuration risks.	Review the controls and verify any changes in staging.
One sample broken link LOW	A broken link may interrupt a visitor journey.	Update or remove the illustrative broken link.

Improvement opportunities

Mobile performance investigation - LOW

One fictional Lighthouse result suggests the selected example page could benefit from optimisation. A single lab run cannot establish the experience of every visitor.

Ongoing protection

Continuous uptime monitoring - INFORMATIONAL

A one-off assessment cannot establish ongoing availability. Consider continuous monitoring as an optional service, not as a confirmed website fault.

KEEPING YOUR WEBSITE HEALTHY

After your one-off check

The health check is a snapshot. Website software, availability, backups and security configuration can change after the assessment. DevEdge Website Support provides ongoing monitoring, maintenance and technical assistance according to your chosen plan.

Depending on plan: availability monitoring; software updates; security and vulnerability monitoring; backups and verification; recurring website health checks; technical support.

What happens next

OPTION 1 - ONE-OFF FIX PACK

For qualifying findings, DevEdge can assess and quote for a defined set of remedial tasks. The exact scope and price should be confirmed before work begins.

Demonstration only: Any price or offer in a real report is determined by that service and its published terms; no offer is made by this sample document.

OPTION 2 - ONGOING WEBSITE SUPPORT

Essential, Standard and Pro plans may include different support hours, update schedules and monitoring intervals. Actual pricing and inclusions are shown on the DevEdge website.

See devedge.co.uk for current service details. This public sample does not include checkout links, billing information or customer-specific offers.

This page illustrates the commercial section that a paying client may receive. It is not a personalised quote.

ASSESSMENT COVERAGE & METHODOLOGY

How this example was constructed

This sample is synthetic. It was composed to demonstrate the appearance and structure of a DevEdge One-Off Website Health Check. No scan of example.com was carried out and none of the findings indicate real security weaknesses.
In a real assessment, coverage varies with available website data. Unverified and untested results are not automatically failures.

Illustrative check coverage

WordPress core version	Passed
Plugin and theme maintenance	Attention Required
Known vulnerabilities	Potential Issue
Security configuration	Attention Required
Administrator access	Informational
SSL certificate	Passed
Backup health	Not Verified
Selected page performance	Potential Issue
Uptime monitoring	Not Verified
Email authentication	Passed
Broken links	Attention Required
Database health	Passed

Assessment limitations

A real one-off report may use the DevEdge Connect plugin, publicly available domain/DNS records and page performance tools. Automated results do not replace manual security reviews, penetration testing, a complete SEO audit or ongoing monitoring.
